

THE PROBLEM

Public health insurance programs process large volumes of hospital claims every day. PM-JAY — one of the world's largest schemes — covers hospitals across diverse infrastructure settings. Claim packets arrive as scanned summaries, handwritten notes, lab reports, and photographs. Review today is manual, inconsistent, and hard to audit.

1 — Is the packet complete?

2 — Does the timeline make sense?

3 — Is there enough evidence?

THE SOLUTION

ClaimSetu converts messy claim packets into structured, evidence-backed review findings. It does not approve or reject claims — it supports human reviewers with structured evidence.

HOW IT WORKS

Local-first via Ollama — Gemma 4 runs on-device. No patient data leaves the machine.

OCR reads. Gemma understands. Humans decide.
